

# Role of microorganisms in foods

---

Food preservation

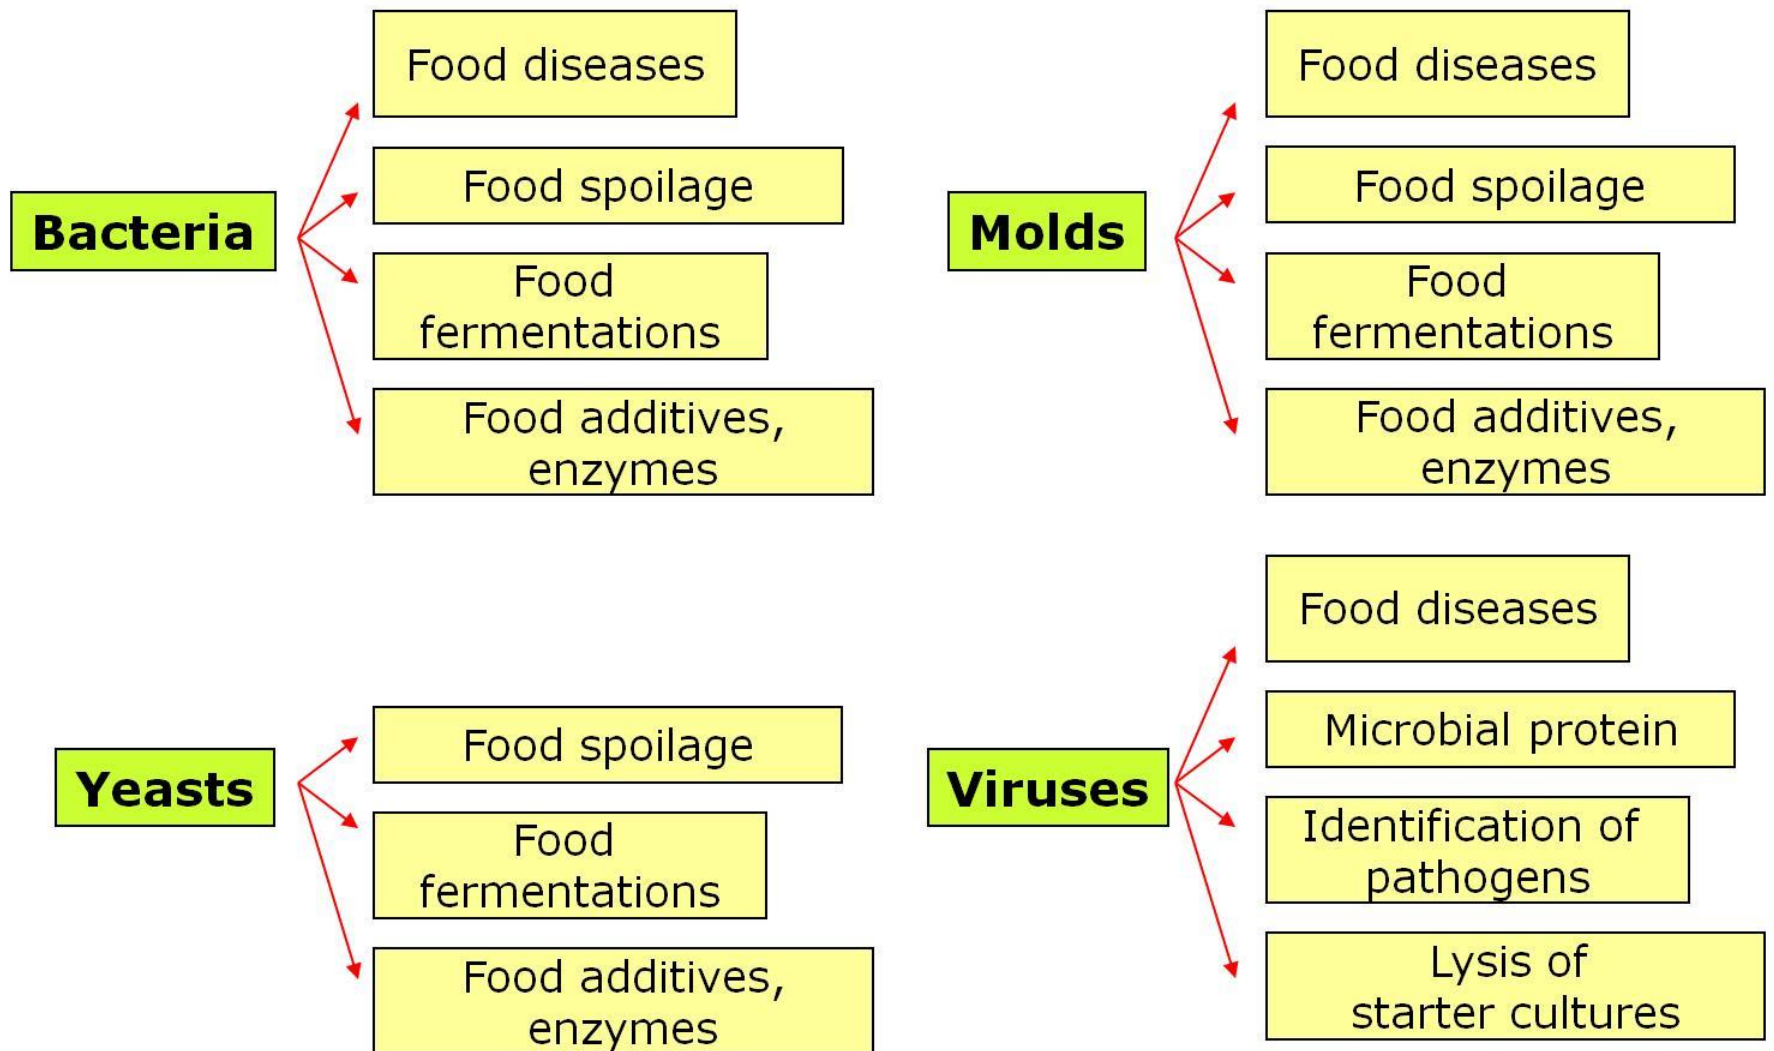

Food spoilage

Food pathogens

# Microorganisms in foods

# Microorganisms in foods

---

## Bacteria

---

<i>Acinetobacter</i>	<i>Erwinia</i>	<i>Pediococcus</i>
<i>Aeromonas</i>	<i>Escherichia</i>	<i>Proteus</i>
<i>Alcaligenes</i>	<i>Flavobacterium</i>	<i>Pseudomonas</i>
<i>Arcobacter</i>	<i>Hafnia</i>	<i>Psychrobacter</i>
<i>Bacillus</i>	<i>Kocuria</i>	<i>Salmonella</i>
<i>Brochotrix</i>	<i>Lactococcus</i>	<i>Serratia</i>
<i>Campilobacter</i>	<i>Lactobacillus</i>	<i>Shewanella</i>
<i>Carnobacterium</i>	<i>Leuconostoc</i>	<i>Shigella</i>
<i>Citrobacter</i>	<i>Listeria</i>	<i>Staphylococcus</i>
<i>Clostridium</i>	<i>Micrococcus</i>	<i>Vagococcus</i>
<i>Corynebacterium</i>	<i>Moraxella</i>	<i>Vibrio</i>
<i>Enterobacter</i>	<i>Paenibacillus</i>	<i>Weissella</i>
<i>Enterococcus</i>	<i>Pantoea</i>	<i>Yersinia</i>

# Microorganisms in foods

---

## Molds

---

<i>Alternaria</i>	<i>Cladosporium</i>	<i>Mucor</i>
<i>Aspergillus</i>	<i>Colletotrichum</i>	<i>Penicillium</i>
<i>Aureobasidium</i>	<i>Fusarium</i>	<i>Rhizopus</i>
<i>Botrytis</i>	<i>Geotrichum</i>	<i>Trichotecium</i>
<i>Byssochlamys</i>	<i>Monilia</i>	<i>Wallemia</i>
		<i>Xeromyces</i>

---

## Yeasts

---

<i>Bretannomyces</i>	<i>Issatchenkia</i>	<i>Schizosaccharomyces</i>
<i>Candida</i>	<i>Kluyveromyces</i>	<i>Torulaspora</i>
<i>Cryptococcus</i>	<i>Pichia</i>	<i>Trichosporon</i>
<i>Debaryomyces</i>	<i>Rhodotorula</i>	<i>Zygosaccharomyces</i>
<i>Hanseniaspora</i>	<i>Saccharomyces</i>	

---

## Protozoa

---

<i>Cryptosporidium parvum</i>	<i>Cyclospora cayetanensis</i>	<i>Entamoeba histolytica</i>
<i>Giardia lamblia</i>	<i>Toxoplasma gondii</i>	

---

# Historical development

---

- ❑ First data - 10,000 years ago
- ❑ 6,000 years ago – cereal products through heat treatment (cooking), cereal fermentation

# Historical development

---

- ❑ 3,000 r. BC, Sumerians – breeding of domestic animals, dairy products (butter)
- ❑ 3,000 - 1,200 r. BC, Jews - salt for food preservation, later adopted in ancient China, Greece and Rome

# Historical development

---

- ❑ 3,500 r. BC, Assyria - wine

- ❑ 1500 r. BC, Babylon and China – fermented sausages

# Historical development

---

- ❑ 13<sup>th</sup> century, Sweden - first legal provisions for mandatory inspection of slaughterhouses

# Historical development

---

- ❑ 17<sup>th</sup> century, Kircher – role of microorganisms for food spoilage
- ❑ Antony van Leeuwenhoek, 1680 – observed yeast cells

# Historical development

---

- ❑ Nicolas Appert, 1810 – preservation of meat through heat treatment

*Nicolas Appert*

*Bouteille de  
stérilisation*

# Historical development

- ❑ 1857-76, Pasteur - MO (yeasts and bacteria) are responsible for the chemical changes during production and for spoilage of foods and beverages, for acidification of milk; heat treatment to destroy unwanted microorganisms in wine and beer - "**pasteurization**"

# Growth of MO in food

- Growth of microorganisms – exponential curve

# Growth of MO in food

---

- ❑ Growth rate varies depending on the specific microorganism and food
- ❑ Growth inside foods or on their surface

# Nutrition of microorganisms

Food components	Microorganisms
<b><u>C-sources</u></b>	
Glucose	All MO, concentration in foods is not significant
Galactose	Certain MO, concentration in foods is not significant
Lactose	High concentration in dairy matrices, used by a limited number of MO – lactic acid bacteria, coliforms
Fats	Only MO with lipase activity - <i>Pseudomonas fluorescens</i>
Proteins	Only MO with proteolytic activity - <i>Pseudomonas fluorescens</i>
Aminoacids	All microorganisms
Citrate	Only certain MO - <i>Klebsiella spp</i> , <i>Lactococcus lactis</i>
<b><u>N- sources</u></b>	
Aminoacids	All microorganisms
Amonia	All microorganisms
Urea	Only MO with urease activity - <i>Proteus</i>
<b>Proteins</b>	Only MO with proteolytic activity - <i>Pseudomonas fluorescens</i>
<b><u>Minerals</u></b>	All microorganisms – essential for growth
<b><u>Microelements</u></b>	All microorganisms – essential for growth
<b><u>Vitamins</u></b>	All microorganisms – essential for growth
<b><u>Purines and pyrimidines</u></b>	All microorganisms – essential for growth

# Death factors for microorganisms

---

- ❑ Nutrient depletion
- ❑ pH changes in cell environment
- ❑ Accumulation of inhibitory metabolites
- ❑ Lack of oxygen (aerobic MO)
- ❑ Combinations of the above factors

# Active antimicrobial agents

---

- ❑ Heat - high temperature, steam
- ❑ Chemical agents - disinfectants, preservatives, antibiotics
- ❑ Extreme pH
- ❑ Radiation - ultraviolet light, ionizing radiation, microwaves
- ❑ Low water activity ( $a_w$ ) (drying, salting, other agents)

# Active antimicrobial agents

---

- ❑ Freezing
- ❑ Cooling, cold shock
- ❑ Reduced reduction potential (Eh) (low oxygen)
- ❑ Ultrasonic sound
- ❑ Hydrostatic pressure (100-1000 MPa)
- ❑ Competitive microflora (fermentations)

# Mechanisms of microorganisms death

---

- ❑ Structure of the cell wall
- ❑ Cell membranes
- ❑ Cellular proteins, including enzymes
- ❑ RNA and DNA
- ❑ Mechanisms of synthesis of cell wall and cell growth

# Effect of organic acids on microbial cells

# Effect of pH on microbial cells

Effect of moderate and extreme pH on microbial cells

# Water activity ( $a_w$ )

---

- ▣ Cells of living organisms – more than 75% water, bacterial spores – 15% (dormant state, metabolism is not active)
- Water activity ( $a_w$ )– the amount of water available for microbial growth

$$a_w = \frac{\text{Vapour pressure of a substance or solution}}{\text{Vapour pressure of water at the same temperature}}$$

- Water content  $\neq$  water activity
- For each MO – specific  $a_w$  interval for growth

# Water activity

# Water activity ( $a_w$ )

Substance	$a_w$
Distilled Water	1 [4]
Tap water	0.99
Raw meats	0.99 <sup>[4]</sup>
Milk	0.97
Juice	0.97
Salami	.87 <sup>[4]</sup>
Cooked bacon	< 0.85
Saturated NaCl solution	0.75
Point at which cereal loses crunch	0.65
Dried fruits	0.60 <sup>[4]</sup>
Typical indoor air	0.5 - 0.7
Honey	0.5 - 0.7
Dried fruit	0.5 - 0.6

Microorganism Inhibited	$a_w$
<i>Clostridium botulinum</i> A, B	.97
<i>Clostridium botulinum</i> E	.97
<i>Pseudomonas fluorescens</i>	.97
<i>Clostridium perfringens</i>	.95
<i>Escherichia coli</i>	.95
<i>Salmonella</i>	.95
<i>Vibrio cholerae</i>	.95
<i>Bacillus cereus</i>	.93
<i>Listeria monocytogenes</i>	.92
<i>Bacillus subtilis</i>	.91
<i>Staphylococcus aureus</i>	.86 <sup>[5]</sup>
Most molds	.80 <sup>[5]</sup>
No microbial proliferation	.50

# Water activity ( $a_w$ )

---

$a_w$	Microorganisms generally inhibited by $a_w$ at this point	Examples of foods within this range of water activity.
0.950	<i>Pseudomonas</i> , <i>Escherichia</i> , <i>Proteus</i> , <i>Shigella</i> , <i>Klebsiella</i> , <i>Bacillus</i> , <i>Clostridium perfringens</i> , some yeasts	Highly perishable foods (fresh and canned fruits, vegetables, meat, fish) and milk; cooked sausages and breads; foods containing up to 4oz (w/w) sucrose or 7% NaCl
0.910	<i>Salmonella</i> , <i>Vibrio parabaemolyticus</i> , <i>C. botulinum</i> , <i>Serratia</i> , <i>Lactobacillus</i> , <i>Pediococcus</i> , some molds, <i>Rhodotorula</i> , <i>Pichia</i>	Some cheese (Cheddar, Swiss, Muenster, Provolone), cured meat (ham), some fruit juice concentrates foods containing 55% (w/w) sucrose or 12% NaCl
0.870	Many yeasts ( <i>Candida</i> , <i>Torulopsis</i> , <i>Hansenula</i> ), <i>Micrococcus</i>	Fermented sausage (salami), sponge cakes, dry cheeses, margarine; foods containing 65% (w/w) sucrose (saturated) or 15% NaCl
0.800	Most molds (mycotoxigenic penicillia), <i>Staphylococcus aureus</i> , most <i>Saccharomyces (baillii) spp.</i> , <i>Debaryomyces</i>	Most fruit juice concentrates, sweetened condensed milk, chocolate syrup, maple and fruit syrups, flour, rice, pulses containing 15-17% moisture; fruit cake; country style ham, fondants, high-sugar cakes
0.750	Most halophilic bacteria, mycotoxigenic aspergilli	Jam, marmalade, marzipan, glacé fruits some marshmallows

---

# Water activity ( $a_w$ )

---

0.650

Xerophilic molds  
(*Aspergillus chevalieri*, *A. candidus*, *Wallemia sebi*),  
*Saccharomyces bisporus*

Rolled oats containing ~10% moisture, grained nougats, fudge marshmallows, jelly, molasses, raw cane sugar, some dried fruits, nuts

---

0.600

Osmophilic yeasts  
(*Saccharomyces rouxii*),  
few molds (*Aspergillus ebinulatus*, *Monascus bisporus*)

Dried fruits containing 15-20% moisture; some toffees and caramels, honey

---

0.500

Noodles, spaghetti, etc. containing ~12% moisture; spices containing ~10% moisture

0.400

No microbial proliferation

Whole egg powder containing ~5% moisture

0.300

Cookies, crackers, bread crusts, etc. containing 3-5% moisture

0.030

Whole milk powder containing 2-3% moisture; dried vegetables containing ~5% moisture; corn flakes containing ~5% moisture; dehydrated soups; some cookies, crackers

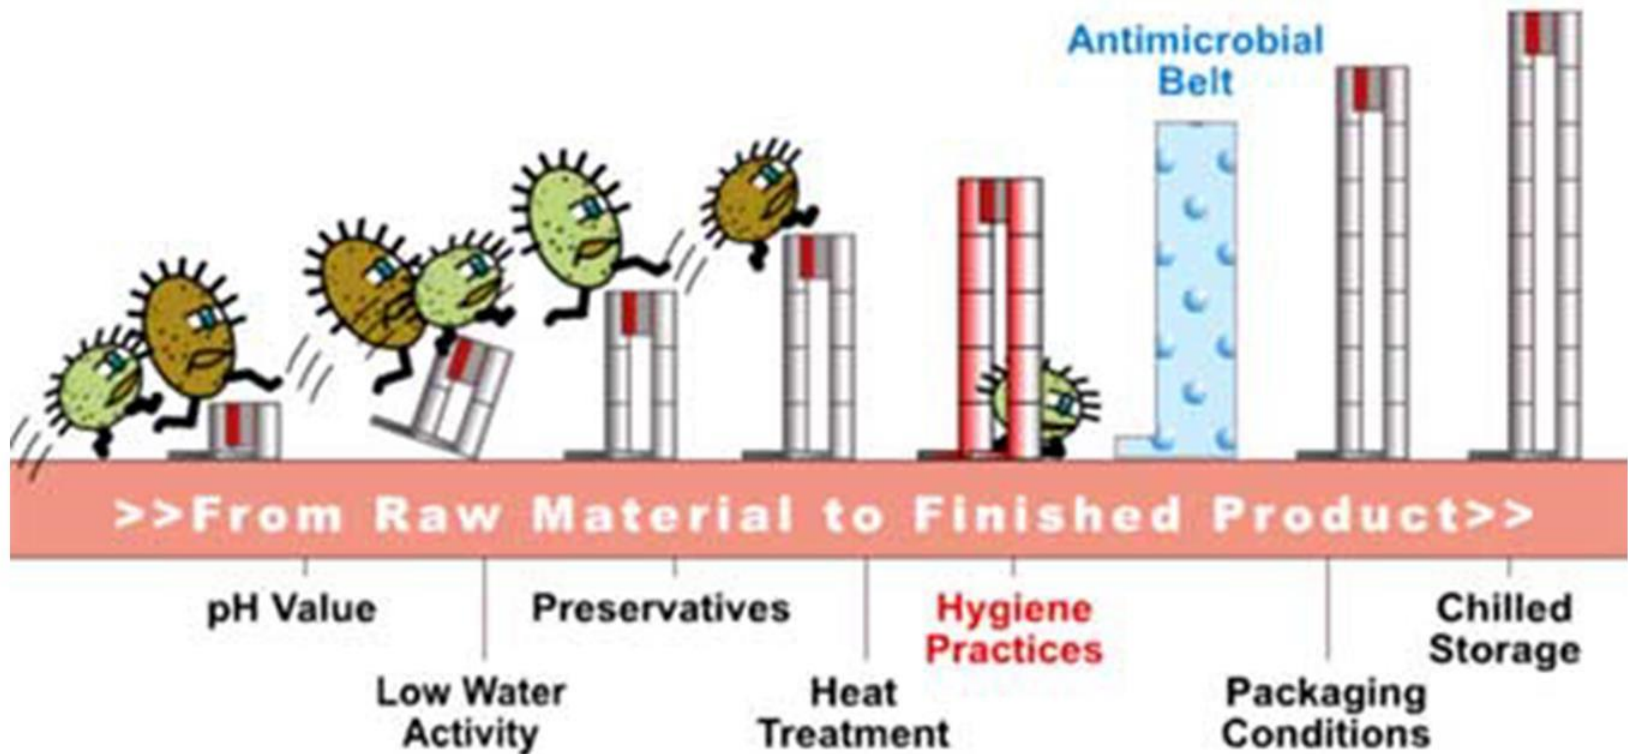

# The hurdle concept

---

- ❑ Safe foods – the use of a single preservative method requires **extreme parameter values** (high salt/sugar concentrations, high acidity, high concentrations of preservatives, severe heat treatment, etc.) – altered characteristics of the product
- ❑ **Hurdle technology** – combination of different inhibiting factors **at lower levels** → effective control and preserved food quality

# The hurdle concept

# Thermal death of microorganisms

---

- ❑ Experimental determination of heat resistance of microorganisms
  - heating is not instantaneous – time lags in heating and cooling
  - complex and expensive apparatus

# Thermal death of microorganisms

---

## Example

- ❑ Cell concentration in a product -  $10^6$  CFU/cm<sup>3</sup> (g)
- ❑ Heating up to  $T > T_{\text{max}}$  for MO growth ( $X^\circ\text{C}$ ) for 5 min, sample for analysis
- ❑ Plate count to estimate the number of living cells
- ❑ Repeat the steps several times

# Thermal death of microorganisms

Procedure for determining the number of survivors

# Thermal death of microorganisms

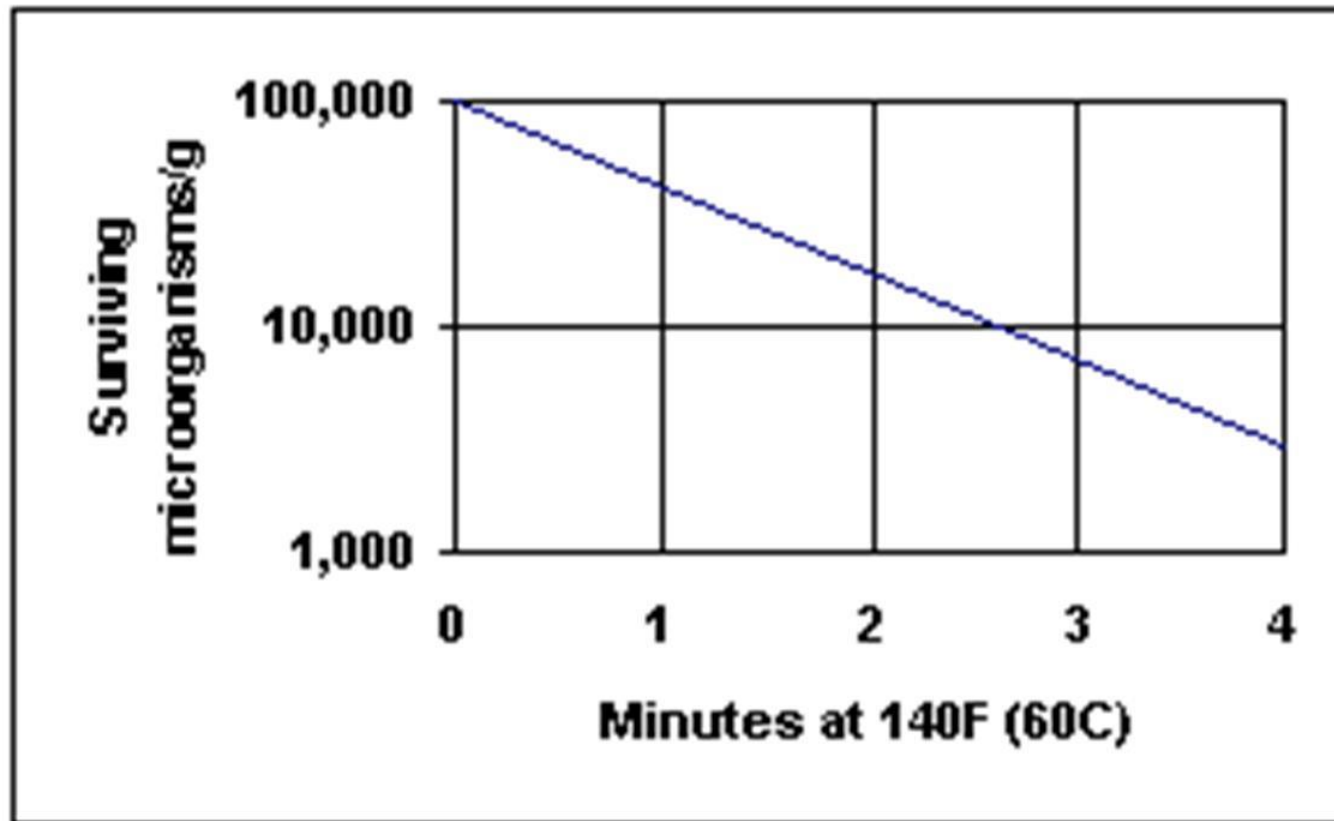

---

Heating time, min	Number of killed cells	Number of surviving cells	Log <sub>10</sub> of surviving cells
0	0	10 <sup>6</sup>	6
5	900 000	10 <sup>5</sup>	5
10	990 000	10 <sup>4</sup>	4
15	999 000	10 <sup>3</sup>	3
20	999 900	10 <sup>2</sup>	2
25	999 990	10 <sup>1</sup>	1
30	999 999	10 <sup>0</sup> (1) (1/ml)	0
35	999 999.9	10 <sup>-1</sup> (1/10 ml)	-1
40	999 999.99	10 <sup>-2</sup> (1/100 ml)	-2

# Survivor curve

---

For 1 log cycle 90% of microbial cells are killed.

# D-values

**D-value:** the time taken for the population to pass through a log cycle

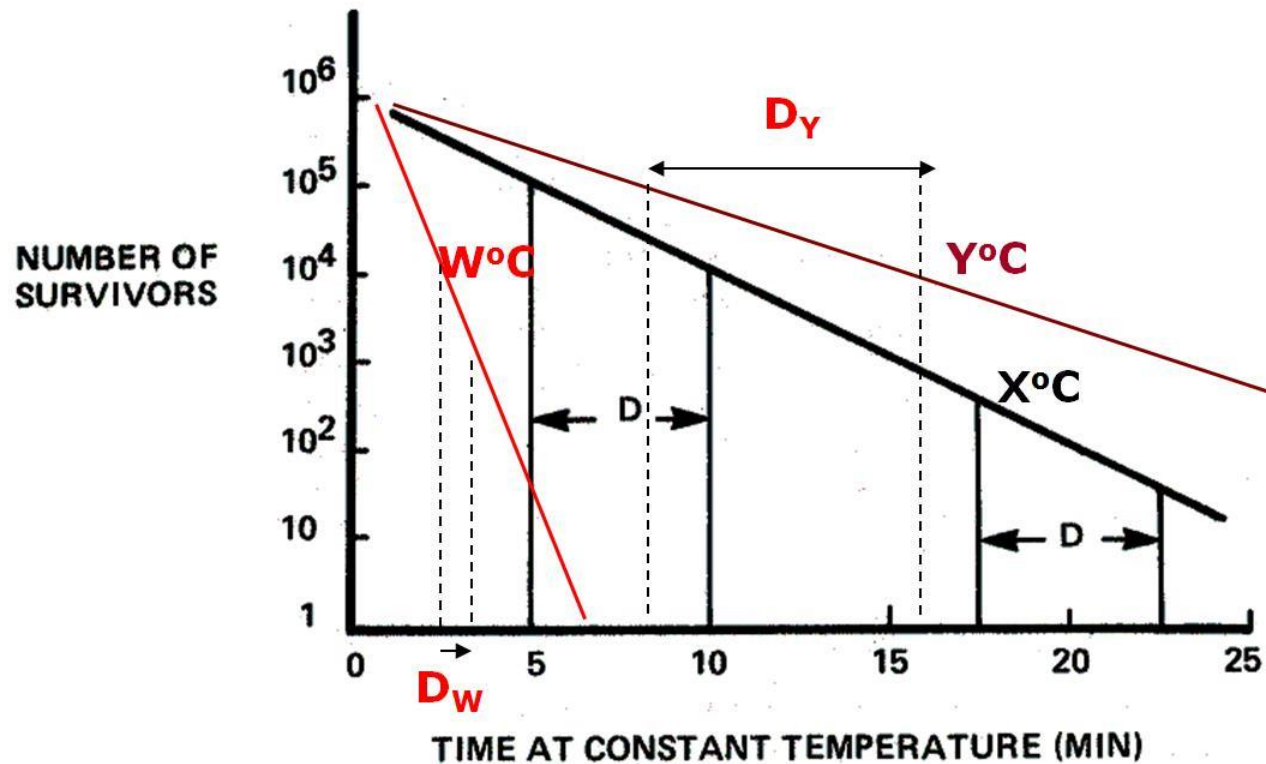

**$D_{121}$ :** time to kill 90% of a population at  $121^\circ\text{C}$

# D-values

---

- ❑ Comparison of the relative heat resistance of microorganisms
- ❑ Calculation of sterilization time
- ❑ Spores of thermophilic bacteria:  $D_{121} = 4 - 5$  min for *Bacillus stearothermophilus*
- ❑ Spores of thermophilic bacteria:  $D_{121} = 0.2 - 0.01$  min
- ❑ Vegetative bacteria, yeasts and molds:  $D_{65} = 0.5 - 3$  min

# Survivor curve at different temperatures

$$W^{\circ}\text{C} > X^{\circ}\text{C} > Y^{\circ}\text{C}$$

# z-values

**z-value:** the change of temperature (°C), required to achieve a 10-fold change of the D-value

# z-values - application

---

- Determination of the equivalent D-values for different temperatures

$z=10^{\circ}\text{C}$ ,  $D_{121} = 5 \text{ min}$ ;

Increase of T from  $121^{\circ}\text{C}$  to  $131^{\circ}\text{C} \rightarrow$

$D_{131} = 0.5 \text{ min}$ ;

Decrease of T from  $121^{\circ}\text{C}$  to  $111^{\circ}\text{C} \rightarrow$

$D_{111} = 50 \text{ min}$ ;

# z-values

---

- ❑ Molds, yeasts and vegetative cells of bacteria:  $z = 5-8^{\circ}\text{C}$  (normally  $5^{\circ}\text{C}$ )
- ❑ Bacterial spores:  $z = 6-16^{\circ}\text{C}$  (normally  $10^{\circ}\text{C}$ )
- ❑ Determination of the equivalent D-values for different temperatures

# Factors influencing heat resistance

---

- ❑ Growth phase: cells of stationary phase are more resistant than cells in log phase
- ❑ Growth temperature: the higher T of growth is, the more resistant are MO
- ❑ pH of the environment: higher heat resistance at pH optimal for growth
- ❑ Fat and protein: protective effect
- ❑ Water activity: reduction of  $a_w$  increases heat resistance
